Resource development in semi-arid lands

This volume, containing the papers presented at a two-day meeting at The Royal Society, provides extensive material for comparative studies of experience, experiment and successful improvement in a wide range of countries. The papers may be grouped under three heads:

- the problems of semi-arid areas,
- the evaluation and exploitation of semi-arid lands,
- and the conservation and improvement of resources.

They will be of great interest and value to those concerned with human welfare in these marginal areas.

CONTRACEPTIVES OF THE FUTURE

A review of the natural constraints on human fertility shows that these mechanisms can no longer be expected to hold human population growth in check in the future; as a species we are therefore going to become increasingly dependent on artificial forms of contraception for the rest of our existence. Much of the contraceptive research in recent years has been aimed at improving the efficiency of existing techniques, which are already highly sophisticated and designed mainly with the developed countries in mind; but the major problems lie in the developing countries where the needs are greatest and the motivation least. More attention must therefore be given to the acceptability of contraceptives, and the development of non-medical channels for their distribution and sale.

Although the techniques at present available seem to be relatively safe and effective, there are still a number of unexplored approaches that can be developed in the years to come. Immunization of women against pregnancy seems to hold some promise, and forms of contraception that result in amenorrhea may also prove increasingly acceptable. Unfortunately there are few promising leads in the direction of male sterilization.

Contributors to this report were experts from the Medical Research Council, the World Health Organization, the Ford Foundation, the Population Council and voluntary family planning organizations.

Turning points in zoological science

A Discussion held on 30 September 1976
Organized by a Committee under the Chairmanship of
Professor R. J. Harrison, F.R.S.
as part of the 150th anniversary celebrations of the
Zoological Society of London

This book contains the papers given at a Discussion Meeting held at the Royal Society on
30 September 1976 to celebrate the 150th anniversary of the Zoological Society of London.
Contributors had been asked to indicate and to discuss some of the advances, in both concepts and
techniques, that have taken place in Zoological Science during the past 150 years. In the preface,
Lord Zuckerman, the President of the Zoological Society, points out how the structural approach
to biological knowledge had been replaced during this period by experimental studies, and thus
zoology had been completely transformed. The eight papers show how this transformation came
about in certain fields of investigation and how it affected our ideas or stimulated further enquiry.
They discuss the evolution of concepts in morphogenesis; how information has been acquired on
the physiology of wild animals; the nature of chemical communication and the discovery of
hormones; chromosomal changes in vertebrate evolution; how genes exert controlled activity and
how novel genetic constitutions can be created; the status of mechanics and field concepts, and
the role of statistical mechanics in developmental biology; integration and teleonomy, hormones
and behaviour.

TECHNOLOGIES FOR RURAL HEALTH

Three-quarters of the people of the world live in rural areas where poverty and ill health are the
norms. This is a problem which is becoming more urgent and will not solve itself; populations
continue to rise faster than food production, water supply is deficient in quality or quantity or both,
medical care is concentrated in urban areas and medical budgets are limited; family planning
schemes have not contained the population rise and infant mortality remains high.

This book contains the papers given at a Royal Society Discussion Meeting held on 9 and
Henderson, F.R.S., at which all aspects of these problems were faced by world experts. Their
analyses of the situation involved both high technology and very simple procedures. They indicate
that concerted properly, organized measures can transform the state of health in rural areas, but
changes are needed in the attitude and approach of many scientists, administrators and local
people. This is a unique book and valuable reading for anyone concerned with the present status
of all aspects of rural health.
